Infrared Services

MDI offers *Infrared Thermography* for your electrical panels /switchgear. We recommend having this service performed bi-annually because of the dangers, damage and expense that can occur due to faulty electrical connections and switchgear.

We also can provide temperature trending for any / each of the bearing points that are included in our route data. This is accomplished using an infrared temperature gun and recording the bearing's surface temperature into the database so that it can be trended. This data offers the analyst an additional tool to assist in making a proper diagnosis of the bearing and machine condition.
